NEWS RELEASE: American Compounding Expansion and Move to Brighton, Michigan

American Compounding announced today that it will be installing an additional 70 mm extrusion line in a 100,000 square foot facility located in Brighton, Michigan in February 2011. The current capacity located in Fowlerville, Michigan will be transitioned to Brighton by July 2011.

David W. Donie and Randy Rudisill, Co-Owners of American Compounding said “Purchase of this new facility, which is approximately 5-times the size of our existing facility, will allow us to add additional capacity and grow with our existing customer base. Installation of a new extrusion line in Brighton will increase our capacity to 90-million pounds annually. This move into a new facility that will support our customer's growth and our long-term business plan is an important step in our mission to be the Best Toll Compounder Our Stakeholders Can Imagine.”

Dr. Rena Pomaville, Director of American Compounding adds, “This move will allow American Compounding to implement improvements to our existing operations and services that have been suggested by our customers, employees and the community thereby adding to the “Total Value Proposition” that has already drawn so many customers to us.”

American Compounding Specialties is a science-based toll compounder (contract manufacturer) of high performance thermoplastics currently based in Fowlerville, Michigan. The company began operations in April 2006 and in 2011 will have approximately 100-million pounds of annual capacity.
